Product presentation

LC-Serie

The LowClamp series, with a completely closed base body, is suitable for any production process. The chips do not remain in the base body and can therefore be easily removed. In automation with a robot, for example, by simply inclining the clamp. The low design enables versatile use with low weight.

Product presentation

Benefits of the LC-Series

Clamping Force

The high clamping forces of the LC series can be influenced via the torque on the spindle. This allows workpieces made of plastic to be clamped without deformation and forged parts to be clamped securely without destroying the clamp.

Centering precision

The design of the LC series guarantees the user precise centring of +/- 0.01 mm in the centre of the clamp.

Accessibility

The flat silhouette of the LC series enables installation on all pallets, towers and pyramids with maximum workpiece dimensions. The symmetrical design of the clamp minimises interfering contours on both sides.

Compact

The compact clamp fits in any machine or on any base plate. The low weight enables manual retooling.

Low maintenance

Thanks to its compact design, the chips do not remain anywhere in the clamp. The spindle remains free of chips, which reduces maintenance to a minimum.

Short set-up times

The LC series can be equipped with various connection options. The standard base from Gremo-tool is suitable for grooved tables and pallet systems. Solutions for perforated grid plates and clamping device handling can also be offered.

Large range of jaws

The entire range of Gremotool jaws can be used on the LC series. From gripper jaws to soft jaws made of aluminium, no wishes remain unfulfilled when it comes to workpiece clamping requirements.

The jaws are equipped with the standardised Gremotool jaw system. This allows you to change the jaws very fast.

Applications

Zero-point clamping system

The basic bodies of the LC series make it possible to use many of the common pallet systems. For this purpose, only 2 fitting holes are required to align the LC correctly on the pallet.

Clamping Device: 1x LC-34
Zero-point clamping System: ITS-50
 (on request)

Clamping Device: 1x LC-60
Zero-point clamping System: ITS-148
 (on request)

Clamping Device: 2x LC-74
Zero-point clamping System: UPC-320

Clamping Device: 2x LC-150
Zero-point clamping System: Delphin-448

Applications

Fixture

To achieve maximum flexibility and running time on the processing machines, you can use the LC series on pyramids, towers, or prisms. The elevated design and the large selection of jaws allows to maximise machine capacity.

**Clamping De-
vice:**
Fixture:

6x LC-34
**Igel-«Hedge-
hogs»**

**Clamping De-
vice:**
Fixture:

5x LC-60
Pyramid

**Clamping De-
vice:**
Fixture:

8x LC-60
Tower

**Clamping De-
vice:**
Fixture:

2x LC-150k
Prism

Self-adjusting

AM-LC-series

The requirements for clamping devices have become increasingly complex with the growing possibilities of production technology. Some workpieces are machined from all sides in one clamping operation and then cut off. Other workpieces have attributes that do not allow a second centric clamping or must not be damaged by it. These examples and also long structural components can warp due to clamping or material removal. For these workpieces, Gremotool has further developed the AM-LC series to meet customer requirements.

Self-adjusting

Self-adjusting means that the workpiece can be clamped at any position on the clamping device and then the entire unit is fixed in place. This makes it possible to fix long workpieces without distortion or workpieces with asymmetrical clamping surfaces. No pendulum or mould jaws are required to hold the workpieces securely.

Advantages AM-LC-series

The AM-LC series has the same dimensions and clamping force as the LC series. For each size of the LC series, there is a corresponding vise from the AM series. Thanks to the identical dimensions, the centrally clamping devices can be used safely on the same workpiece with the AM-LC variant without any special modifications.

Self-adjusting

Application example

1. set up vice

The clamping devices are mounted on the table of the machine tool. The two centric LCs are placed on the outside of the width of the workpiece. The self-adjusting modules are then placed in the centre. The jaws are adjusted to the dimensions of the workpiece.

2. clamping centrally

The workpiece is inserted into the clamping fixture. The outer LC centre clamps are placed against the workpiece first and then the specified clamping torque is applied.

Self-adjusting

Application example

3. clamping self-adjusting module

The workpiece is now fixed by the outer clamping devices. To further improve the clamping stability, the self-adjusting modules now stabilise the workpiece in the centre. The clamping position of the AM-LC adapts to the workpiece during clamping and subsequent application of the same torque.

4. fix self-adjusting module

As the position of the AM-LC is not necessarily in the centre, they must be fixed in place to ensure stable tension. To do this, the fixing screw is tightened to the specified torque. Nothing further stands in the way of distortion-free production.

Self-adjusting

Application example

successful application

- rotary table with clamping bridge and counter bearing on 3-axis vertical machining centre
- 2 pcs LC-60 with grid plate base per clamping bridge side
- 3 pcs AM-LC-60 with grid plate base per clamping bridge side

workpiece

- stainless steel 160 x 40 x 500 up to 1800 mm
- precise workpieces machined without warping are removed

Accessories

Jaws

Pair of standard SC-gripper jaws is supplied with each LowClamp, so, you are already able to clamp parts at no additional costs.

Jaw width [mm]		34	40	50	60	74	100	120	150
SC-LC Gripper jaw low	Nr. 837110			X	X	X	X	X	
Standard SC-LC Gripper jaw	Nr. 837150			X	X	X	X	X	
Standard PMC-HMC Gripper jaw	Nr. 837250			X	X	X	X	X	
Gripper jaw high	Nr. 837300			X	X	X	X	X	
Combi gripper jaw	Nr. 837350			X	X	X	X	X	
Gripper jaw high one sided	Nr. 837380			X	X	X	X	X	
Step jaw high one sided deep	Nr. 837400			X	X	X	X	X	
Step jaw low	Nr. 837410			X	X	X	X	X	
Step jaw	Nr. 837450			X	X	X	X	X	
Step jaw high one sided	Nr. 837480			X	X	X	X	X	
Prism jaw	Nr. 837500			X	X	X	X	X	
Soft jaw aluminium	Nr. 837702			X	X	X	X	X	
Soft jaw steel	Nr. 837703			X	X	X	X	X	

For the exact data of the jaws, please check the jaw catalogue.

Further manufacturers can be requested directly at Gremotool.

Device handling

The LC series can be changed directly on zero-point Systems. For this purpose, the respective suitable drawing for the zero-point system will be integrated in the LC Serie. The clamping process can be carried out manually or by a suitable robot.

Direct clamping

The LC series can be equipped with straightening-elements for the table slot. This allows the user to fix the centre clamp quick and correctly on the slot table.

If the milling table has a hole grid, the straightening elements can be selected on the base of this table. Thanks to the fits, the position is completely determined when fixing. These accessories can be requested and obtained by Gremotool.
